# Seasonal plots

- Data plotted against the individual “seasons” in which the data were observed. (In this case a “season” is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: `gg_season()`

# Quarterly Australian Beer Production

```
beer <- aus_production |>  
  select(Quarter, Beer) |>  
  filter(year(Quarter) >= 1992)  
beer |> autoplot(Beer)
```

# Quarterly Australian Beer Production

```
beer |> gg_season(Beer, labels = "right")
```

# Multiple seasonal periods

vic\_elec

```
# A tsibble: 52,608 x 5 [30m] <Australia/Melbourne>
```

# Multiple seasonal periods

```
vic_elec |> gg_season(Demand)
```

# Multiple seasonal periods

```
vic_elec |> gg_season(Demand, period = "week")
```

# Multiple seasonal periods

```
vic_elec |> gg_season(Demand, period = "day")
```

# Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: `gg_subseries()`

# Quarterly Australian Beer Production

```
beer |> gg_subseries(Beer)
```

# Australian holidays

```
holidays <- tourism |>
  filter(Purpose == "Holiday") |>
  group_by(State) |>
  summarise(Trips = sum(Trips))
```

```
# A tsibble: 640 x 3 [1Q]
```

```
# Key:      State [8]
```

```
  State Quarter Trips
```

```
  <chr>    <qtr> <dbl>
```

1	ACT	1998 Q1	196.
2	ACT	1998 Q2	127.
3	ACT	1998 Q3	111.
4	ACT	1998 Q4	170.
5	ACT	1999 Q1	108.
6	ACT	1999 Q2	125.
7	ACT	1999 Q3	178.
8	ACT	1999 Q4	218.
9	ACT	2000 Q1	158.
10	ACT	2000 Q2	155.

# Australian holidays

```
holidays |> autoplot(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

# Seasonal plots

```
holidays |> gg_season(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

# Seasonal subseries plots

```
holidays |> gg_subseries(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

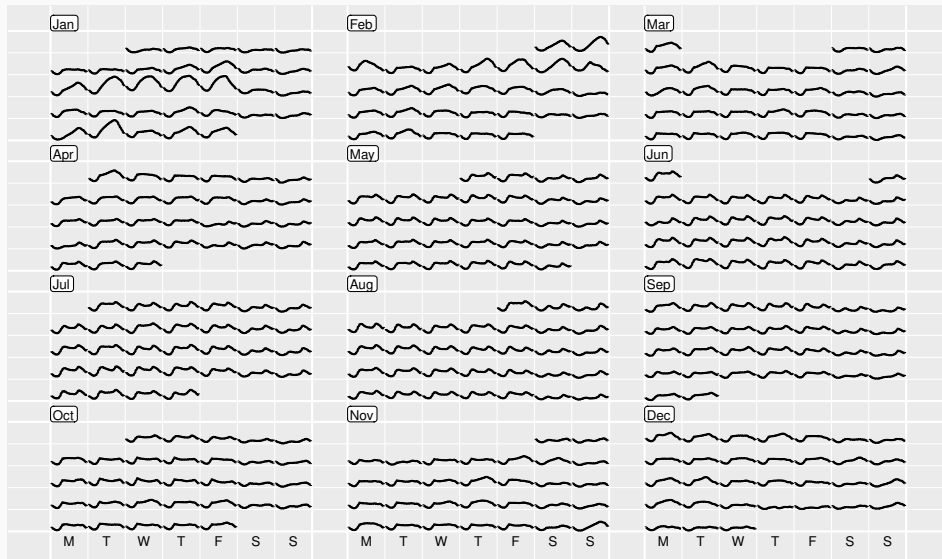

# Calendar plots

```
library(sugrrants)
vic_elec |>
  filter(year(Date) == 2014) |>
  mutate(Hour = hour(Time)) |>
  frame_calendar(x = Hour, y = Demand, date = Date, nrow = 4) |>
  ggplot(aes(x = .Hour, y = .Demand, group = Date)) +
  geom_line() -> p1
prettify(p1,
  size = 3,
  label.padding = unit(0.15, "lines")
)
```

- `frame_calendar()` makes a compact calendar plot
- `facet_calendar()` provides an easier `ggplot2` integration.

# Time series patterns

**Trend** pattern exists when there is a long-term increase or decrease in the data.

**Seasonal** pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).

**Cyclic** pattern exists when data exhibit rises and falls that are *not of fixed period* (duration usually of at least 2 years).

# Time series components

## Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

# Time series patterns

```
aus_production |>  
  filter(year(Quarter) >= 1980) |>  
  autoplot(Electricity) +  
  labs(y = "GWh", title = "Australian electricity production")
```

# Time series patterns

```
aus_production |>  
  autoplot(Bricks) +  
  labs(title = "Australian clay brick production",  
        x = "Year", y = "million units")
```

# Time series patterns

```
us_employment |>  
  filter(Title == "Retail Trade", year(Month) >= 1980) |>  
  autoplot(Employed / 1e3) +  
  labs(title = "Retail employment, USA", y = "Million people")
```

# Time series patterns

```
gafa_stock |>  
  filter(Symbol == "AMZN", year(Date) >= 2018) |>  
  autoplot(Close) +  
  labs(title = "Amazon closing stock price", x = "Day", y = "$")
```

# Time series patterns

```
pelt |>  
  autoplot(Lynx) +  
  labs(title = "Annual Canadian Lynx Trappings",  
        x = "Year", y = "Number trapped")
```

# Seasonal or cyclic?

## Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

# Seasonal or cyclic?

## Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

```
new_production |> gg_lag(Beer)
```

# Example: Beer production

```
new_production |> gg_lag(Beer, geom = "point")
```

# Lagged scatterplots

- Each graph shows  $y_t$  plotted against  $y_{t-k}$  for different values of  $k$ .
- The autocorrelations are the correlations associated with these scatterplots.
- ACF (autocorrelation function):
  - ▶  $r_1 = \text{Correlation}(y_t, y_{t-1})$
  - ▶  $r_2 = \text{Correlation}(y_t, y_{t-2})$
  - ▶  $r_3 = \text{Correlation}(y_t, y_{t-3})$
  - ▶ etc.
- If there is **seasonality**, the ACF at the seasonal lag (e.g., 12 for monthly data) will be **large and positive**.

# Australian holidays

```
holidays |> ACF(Trips) |> autoplot()
```

# Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

# Outline

- 1 Seasonal plots
- 2 Lab Session 3
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4**
- 6 White noise
- 7 Lab Session 5

## Lab Session 4

We have introduced the following functions: `gg_lag` and `ACF`. Use these functions to explore the four time series: `Bricks` from `aus_production`, `Lynx` from `pelt`, Close price of Amazon from `gafa_stock`, Demand from `vic_elec`. Can you spot any seasonality, cyclicity and trend? What do you learn about the series?

# Which is which?

1. Daily temperature of cow

2. Monthly accidental death

3. Monthly air passengers

4. Annual mink trappings

A

B

C

D

# Outline

- 1 Seasonal plots
- 2 Lab Session 3
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise**
- 7 Lab Session 5

# Example: White noise

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)
wn |> autoplot(y)
```

# Example: White noise

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)
wn |> autoplot(y)
```

White noise data is uncorrelated across time with zero mean and constant variance.  
(Technically, we require independence as well.)

# Example: White noise

```
wn |> ACF(y)
```

$r_1$	$r_2$	$r_3$	$r_4$	$r_5$	$r_6$	$r_7$	$r_8$	$r_9$	$r_{10}$
-0.236	0.154	-0.192	0.106	-0.053	0.034	-0.033	0.012	-0.121	0.188

# Example: White noise

```
wn |> ACF(y)
```

$r_1$	$r_2$	$r_3$	$r_4$	$r_5$	$r_6$	$r_7$	$r_8$	$r_9$	$r_{10}$
-0.236	0.154	-0.192	0.106	-0.053	0.034	-0.033	0.012	-0.121	0.188

- Sample autocorrelations for white noise series.
- Expect each autocorrelation to be close to zero.
- Blue lines show 95% critical values.

## Example: Pigs slaughtered

```
pigs <- aus_livestock |>
  filter(State == "Victoria", Animal == "Pigs", year(Month) >= 2014)
pigs |> autoplot(Count / 1e3) +
  labs(x = "Year", y = "Thousands",
       title = "Number of pigs slaughtered in Victoria")
```

# Example: Pigs slaughtered

```
pigs |>  
  ACF(Count) |>  
  autoplot()
```

## Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018  
(Source: Australian Bureau of Statistics.)

## Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018  
(Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

## Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018  
(Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

These show the series is **not a white noise series**.

# Outline

- 1 Seasonal plots
- 2 Lab Session 3

- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

## Lab Session 5

You can compute the daily changes in the Google stock price in 2018 using

```
dgoog <- gafa_stock |>  
  filter(Symbol == "GOOG", year(Date) >= 2018) |>  
  mutate(diff = difference(Close))
```

Does `diff` look like white noise?
