Seasonal plots

- Data plotted against the individual "seasons" in which the data were observed. (In this case a "season" is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: gg_season()

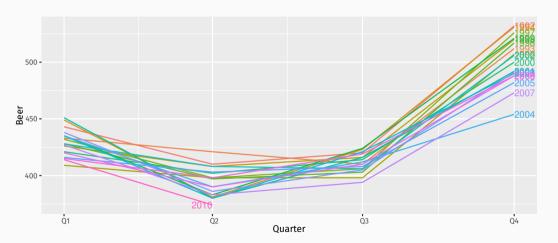

Quarterly Australian Beer Production

```
beer <- aus_production |>
  select(Quarter, Beer) |>
  filter(year(Quarter) >= 1992)
beer |> autoplot(Beer)
```

Quarterly Australian Beer Production

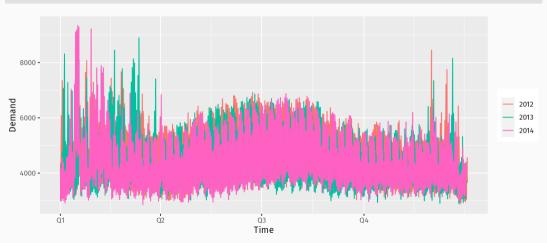

beer |> gg_season(Beer, labels = "right")

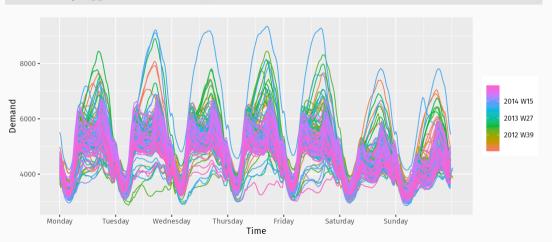

vic_elec

```

vic_elec |> gg_season(Demand)

vic_elec |> gg_season(Demand, period = "week")

vic_elec |> gg_season(Demand, period = "day")

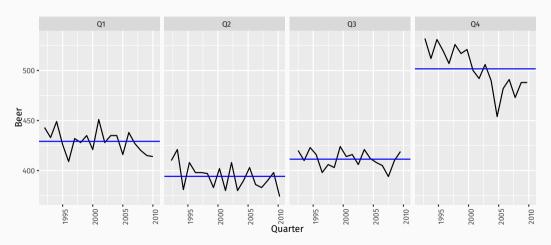

Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: gg_subseries()

Quarterly Australian Beer Production

beer |> gg_subseries(Beer)

Australian holidays

```
holidays <- tourism |>
  filter(Purpose == "Holiday") |>
  group_by(State) |>
  summarise(Trips = sum(Trips))
# A tsibble: 640 x 3 [10]
# Key:

Australian holidays

```
holidays |> autoplot(Trips) +
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

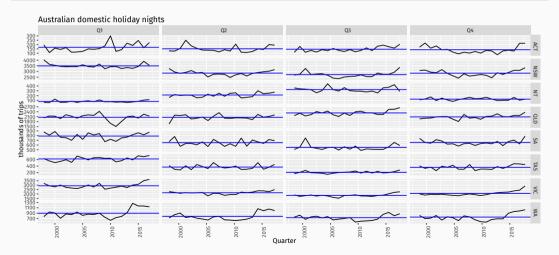

Seasonal plots

```
holidays |> gg_season(Trips) +
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

Seasonal subseries plots

```
holidays |> gg_subseries(Trips) +
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

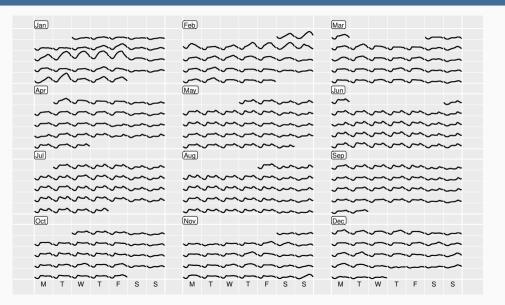

Calendar plots

```
library(sugrrants)
vic elec |>
 filter(year(Date) == 2014) |>
 mutate(Hour = hour(Time)) |>
 frame_calendar(x = Hour, y = Demand, date = Date, nrow = 4) |>
 ggplot(aes(x = .Hour, y = .Demand, group = Date)) +
 geom_line() -> p1
prettifv(p1,
 size = 3.
 label.padding = unit(0.15, "lines")
```

- frame_calendar() makes a compact calendar plot
- facet_calendar() provides an easier ggplot2 integration.

Calendar plots

Outline

- 1 Seasonal plots
- 2 Lab Session 3
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

Lab Session 3

Look at the quarterly tourism data for the Snowy Mountains

```
snowy <- tourism |>
filter(Region == "Snowy Mountains")
```

- ► Use autoplot(), gg_season() and gg_subseries() to explore the data.
- What do you learn?
- Produce a calendar plot for the pedestrian data from one location and one year.

Outline

- 1 Seasonal plots
- 2 Lab Session
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

Trend pattern exists when there is a long-term increase or decrease in the data.

Seasonal pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).

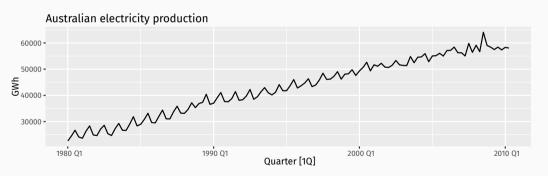

Cyclic pattern exists when data exhibit rises and falls that are *not of fixed period* (duration usually of at least 2 years).

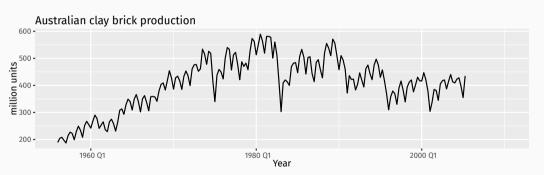

Time series components

Differences between seasonal and cyclic patterns:

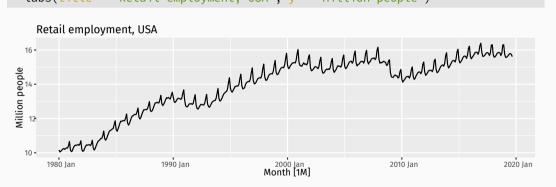

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

```
aus_production |>
  filter(year(Quarter) >= 1980) |>
  autoplot(Electricity) +
  labs(y = "GWh", title = "Australian electricity production")
```

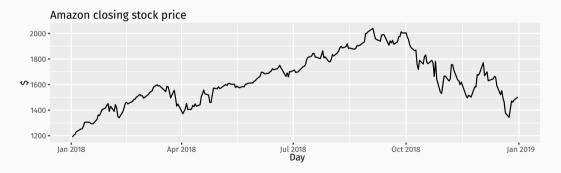

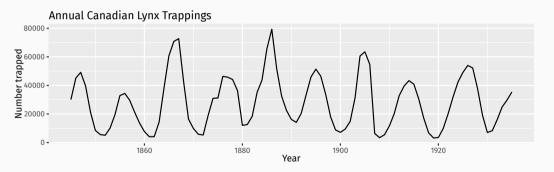

```
us_employment |>
  filter(Title == "Retail Trade", year(Month) >= 1980) |>
  autoplot(Employed / 1e3) +
  labs(title = "Retail employment, USA", y = "Million people")
```

```
gafa_stock |>
  filter(Symbol == "AMZN", year(Date) >= 2018) |>
  autoplot(Close) +
  labs(title = "Amazon closing stock price", x = "Day", y = "$")
```

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

Example: Beer production

new_production |> gg_lag(Beer)

Example: Beer production

new_production |> gg_lag(Beer, geom = "point")

Lagged scatterplots

- Each graph shows y_t plotted against y_{t-k} for different values of k.
- The autocorrelations are the correlations associated with these scatterplots.
- ACF (autocorrelation function):
 - $ightharpoonup r_1 = Correlation(y_t, y_{t-1})$
 - $ightharpoonup r_2 = Correlation(y_t, y_{t-2})$
 - $ightharpoonup r_3 = Correlation(y_t, y_{t-3})$
 - etc.
- If there is **seasonality**, the ACF at the seasonal lag (e.g., 12 for monthly data) will be **large and positive**.

Australian holidays

holidays |> ACF(Trips) |> autoplot()

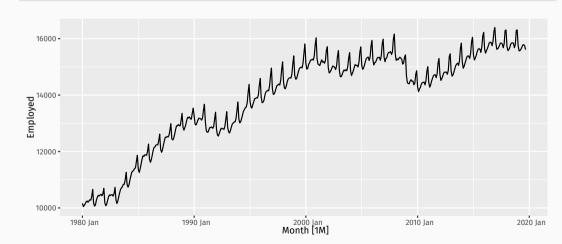

Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

- 2 Lab Session
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

Lab Session 4

We have introduced the following functions: gg_lag and ACF. Use these functions to explore the four time series: Bricks from aus_production, Lynx from pelt, Close price of Amazon from gafa_stock, Demand from vic_elec. Can you spot any seasonality, cyclicity and trend? What do you learn about the series?

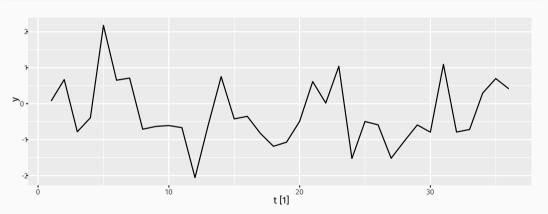

Which is which?

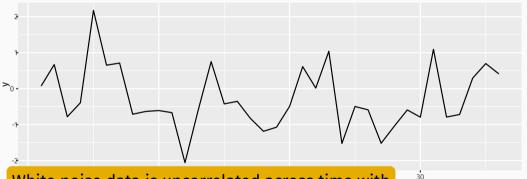

Outline

- 1 Seasonal plots
- 2 Lab Session
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)
wn |> autoplot(y)
```

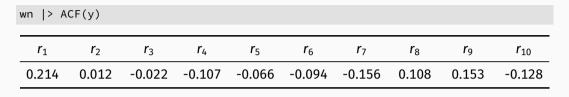

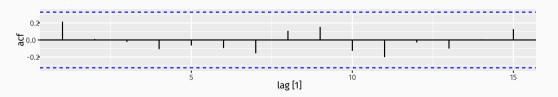

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)
wn |> autoplot(y)
```

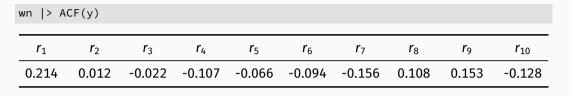

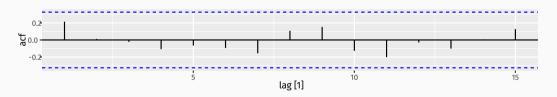

White noise data is uncorrelated across time with zero mean and constant variance.

(Technically, we require independence as well.)

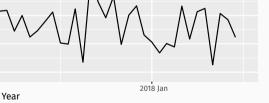

- Sample autocorrelations for white noise series.
- Expect each autocorrelation to be close to zero.
- Blue lines show 95% critical values.

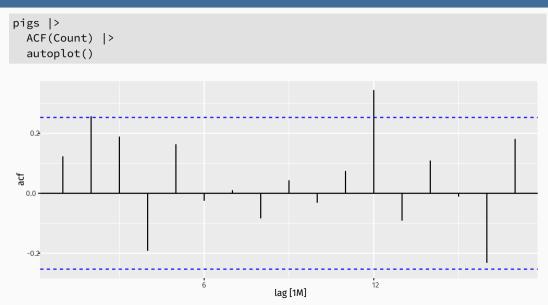

80 -

2014 lan

2016 lan

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

These show the series is not a white noise series.
